Ultrasound – Anechoic vs Hyperechoic

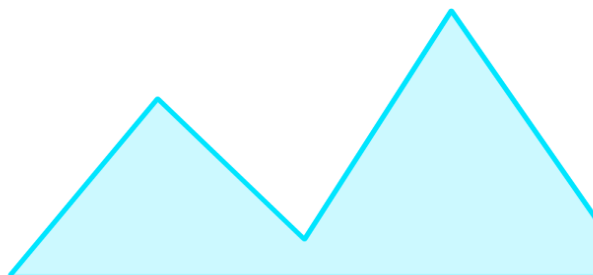

Chapter 1: US Physics

- Sound waves 2-15 MHz. No radiation, real-time.
- Echogenicity: anechoic (black fluid), hypoechoic (dark), hyperechoic (bright).
- Probe types: linear (superficial), curvilinear (abdomen), phased array (heart).

Chapter 2: Knobology

- Gain: brightness. Depth: penetration. Focus: resolution zone.
- Freeze + measure: distance, area.
- Doppler: color shows flow direction.

Ultrasound - Anechoic vs Hyperechoic

Chapter 3: FAST & Basic Scans

- FAST: free fluid in trauma - Morison, splenorenal, pelvis, pericardium.
- Gel is mandatory, minimal pressure.
- Document with patient ID and probe marker.
